CAUTION

- 1) The M2PRU's output waveform is not uniform due to its scaling method. The user must be aware that it may be inconvenient for certain types of application.
- 2) The M2PRU is designed to accept at the maximum of 100 kHz, which may cause errors due to chattering in the input pulses.

A filter circuitry (time constant: approx. 1 msec.) is incorporated to eliminate unwanted chattering when the mechanical contact input is specified. It is effective for

most relay types, however, an external CR filter as indicated below, could be added if the user need improvement. Limit the input frequency to 10 Hz at maximum.

GENERAL SPECIFICATIONS

Construction: Plug-in

Connection: M3 screw terminals (torque 0.8 N·m)

Housing material: Flame-resistant resin (black)

Isolation: Input to output to power

Chattering protection: Filter provided for mechanical contact input (time constant: approx. 1 msec.)

Input pulse sensing: DC coupled; capacitor coupling (automatic trigger*) is field selectable with the side DIP switch for the voltage pulse input.

*Capacitor coupling, with which the detecting levels are automatically set within two peaks of the waveforms, is effective way to detect those with DC offset. However, it may be ineffective if the duty ratio is extremely high or low. The automatic trigger method can compensate such irregular pulses.

Scaling factor adjustment: 10-position rotary switch (front); $1.0000 \times 10^0 - 0.0001 \times 10^{-6}$; factory set to 1.0000×10^0 if not specified when ordering

Output pulse width adjustment: Single-turn screwdriver adjustment (front); 5 μ sec. – 400 msec. (one-shot type); Factory set to 5 μ sec. except for the mechanical contact input set to 15 msec. or AC/DC switch output set to 500 μ sec.

(Min. 400 μ sec. recommended for AC/DC switch output of which the internal voltage drop value may increase with a shorter pulse width.)

Output pulse width range selector: Double-throw SW (front)
