A specific sensitivity scale is applied according to the pulse amplitude by setting up the DIP switch and PC Configurator Software (model: JXCON). The scaled input voltage is then compared to the detecting level at -2.00 through +4.00V. With DC coupling, the scaled maximum input voltage level must be higher than and the scaled minimum input voltage level must be lower than the detecting level so that the pulse state is accurately detected.

PERFORMANCE

Accuracy: Input accuracy + output accuracy

Inversely proportional to the span.

Input accuracy: ± 0.03 % of the selected freq. range

(The input span 100 kHz is used for calculation with 0 – 200 kHz range. The input accuracy is fixed at ± 0.03 % when [Frequency range / Input span] equals 1 or less.)

Output accuracy: ± 0.03 % of the selected output range

See CALCULATION EXAMPLES OF OVERALL ACCURACY.

Temp. coefficient: ± 0.015 %/°C (± 0.008 %/°F) of I/O range at -5 to +55°C [23 to 131°F]

Response time: 0.5 sec. + 1 pulse cycle (0 – 90 %)

Line voltage effect: ± 0.1 % over voltage range

Insulation resistance: ≥ 100 M Ω with 500 V DC

Dielectric strength: 2000 V AC @1 minute (input to output to power to ground)

CALCULATION EXAMPLES OF OVERALL ACCURACY

[Example] Open collector input, 0 – 50 kHz; 1 – 5 V output.

Selected freq. range (100 kHz) \div Input span (50 kHz) \times

Accuracy (0.03 %) = 0.06 % (Input accuracy)

Selected output range (20 V) \div Output span (4 V) \times

Accuracy (0.03 %) = 0.15 % (Output accuracy)

Overall accuracy = 0.06 + 0.15 = ±0.21 %
