NPort Serial Device Server Solutions

NPort 4511

1-Port RS-232/422/485 Programmable Communication Gateway

Features

- NPort 4511's programmable nature makes it suitable for all industrial automation applications
- High speed RS-232/422/485 and Ethernet interfaces for serial device networking
- Customizable programming for IA communication protocol conversion
- Can be controlled and managed from a remote location
- · Reliable system kernel suitable for secure and long-running SCADA-type applications

CE FC 🚇 🛋 🗲

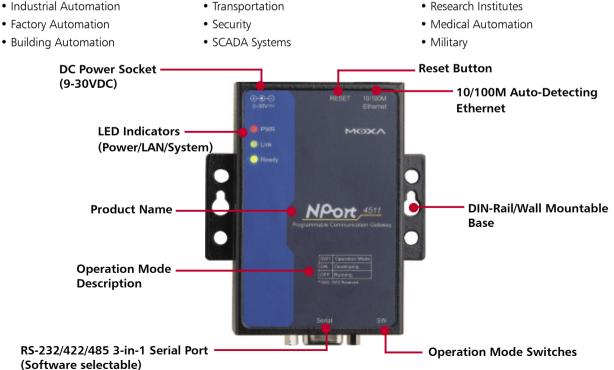

Overview

NPort 4511 is a professional Programmable Communication Gateway that makes your RS-232/422/485 devices networkready, and its programmable nature makes it a valueadded developing platform suitable for protocol conversion

applications. NPort 4511 is a flexible, reliable, cost-effective, and customizable solution that gives System Integrators greater design flexibility.

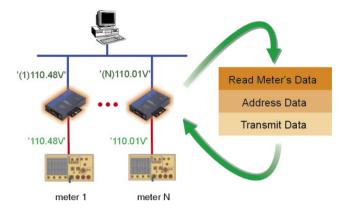

Target Markets

- Industrial Automation
- Factory Automation

Typical Applications

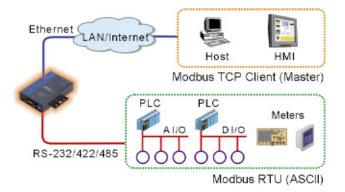

Front-End Data Processing

Since NPort 4511 is programmable, data processing subroutines can be easily ported to NPort 4511 from a host to increase system performance, and to simplify host programming. Use NPort 4511 for Front-End Processing tasks such as:

- Serial device addressing
- Data trimming
- Data tagging
- Data encryption
- Character case conversion

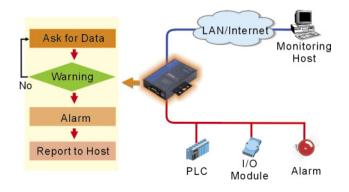

Protocol Conversion Communication

NPort 4511 not only makes your RS-232/422/485 devices network-ready, but also provides protocol conversion capability. This makes upgrading legacy serial devices to the network level quicker and easier, and helps bring your device network up-to-date with current network communication trends, such as:

- PLC communication (Modbus, DF1, etc.)
- Proprietary Protocol Conversion (Power, Military, etc.)

Programmable I/O Controller

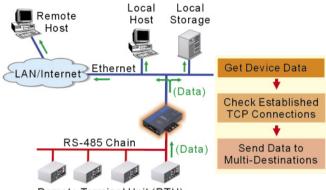

Front-End Control and Real-Time Processing are the application models used most frequently in the IA (Industrial Automation) arena. Due to its 186 CPU and Moxa OS, NPort 4511 is suitable for most applications of this type, allowing you to replace your high-cost, low-reliability front-end PCs, and enact real-time monitoring and reporting applications.

NPort 4511, 1-Port RS-232/422/485 Programmable Communication Gateway

Multicasting/Multi-Destination Communication

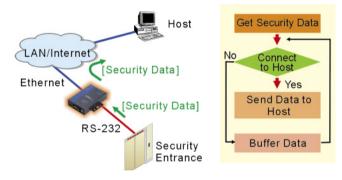

This type of application involves transmitting data simultaneously from a serial device to multiple networked hosts. Since more than one host can access or control an NPort 4511 via an Ethernet LAN or the Internet at the same time, this makes it easy to implement data backup and system redundancy. Increase your system's reliability by using NPort 4511 to do what ordinary device servers can't do.

Remote Terminal Unit (RTU)

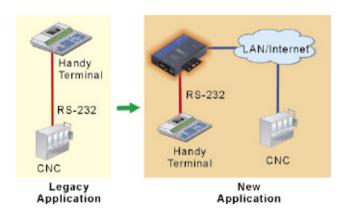

Data Buffering

This function is designed for systems that do not transmit data continuously, but require high reliability. For example, security systems transmit data intermittently and use a random connection method to conserve resources. This type of system usually takes more time to establish or recover an Ethernet connection, and NPort 4511's data buffering capability keeps data safe while waiting for a connection to be established, ensuring communication reliability and topnotch network performance.

Peer-to-Peer Communication

Should you add a high-cost data forwarding PC for upgrading device-to-device communication from serial to Ethernet, or use an NPort 4511 instead? Take advantage of NPort 4511's programmability. Reduce system cost and increase system reliability by changing from legacy serial to Ethernet communication.

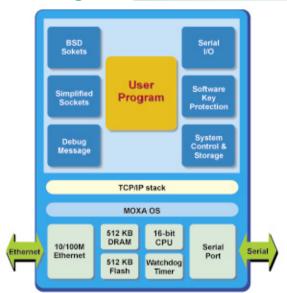

Software Intellectual Property Protection (IPP)

System integrators' valuable knowledge often helps customers solve all kinds of problems. NPort 4511 provides built-in software protection that can protect your intellectual property from unauthorized copying. NPort 4511's SDK allows you to set up a secret key on the hardware and in the User Application. When both keys match, the User Application can be downloaded into the coded NPort 4511 hardware.

License Control for Your Projects

Once the software design is finished, you can make sure that you are the sole supplier of the solution. Customers must acquire the product from you, and unauthorized copying and license control is no longer a problem.

NPort 4511 System Block Diagram

How to Develop an Application on NPort 4511

Step 1: Set up the development environment

- (1) Connect NPort 4511 to a host via an Ethernet network.
- (2) Connect NPort 4511 to a target device via serial port.
- (3) Install SDK utility, library, and Turbo C compiler on the host computer.
- (4) Use SDK utility to configure the IP address of the NPort 4511.

Step 2: Coding & Debugging

- (1) Develop a User Application with Turbo C and SDK's C library.
- (2) Compile & link an executable binary file with Turbo C.
- (3) Download the program and debug with SDK manager.

Step 3: Deployment

- (1) Use SDK utility to set up a software key on NPort 4511 and in the User Application
- (2) Download the finished program to NPort 4511.
- (3) NPort 4511, with your own program installed, is ready to ship.

Professional Software Development Kit (SDK)

NPort 4511 provides developers with a complete and easy-to-use Software Development Kit (SDK). SDK is divided into 3 major parts:

- Library: More than 100 intuitive C funtion calls.
- Utilities: Windows interface for complete NPort 4511 configuration and debugging.
- **Examples:** Several comprehensive programming examples—from basic operation to advanced applications—to get your NPort 4511 up and running in no time.

Our detailed manuals and on-line documentation take you step-by-step from program development to debugging.

SDK Library—Easy to Understand, Easy to Use

The SDK Library functions used to operate NPort 4511's hardware are divided by attribute into 5 groups.

• Serial Port Control

Serial port operation, such as data I/O or changing modem signals.

• Ethernet Control

In addition to standard BSD Sockets, Moxa provides an easyto-use simplified socket library, making both senior and junior developers expert at NPort 4511 Ethernet programming.

• System Control

Helps developers design in-depth system control functions, such as restarting NPort 4511.

• Flash Access

Lets developers easily access the 32 KB flash memory.

Debugging Messages

Lets developers and users use SDK Debugger to monitor NPort 4511's operation status.

All data processing can be done with standard C libraries, before data is sent out from NPort 4511, so that programmers can use the most familiar programming interface to take care of development tasks.

Comprehensive Management Utility

You get a simple but effective way to communicate with or control NPort 4511 during each development stage by using different SDK utilities. The utilities provided are:

- Management Tool: Used for NPort 4511 configuration and software downloading.
- Debugging Tool: Used for debugging and monitoring NPort 4511's operation.
- Packing Tool: Creates a downloadable program and adds NPort 4511 software protection.

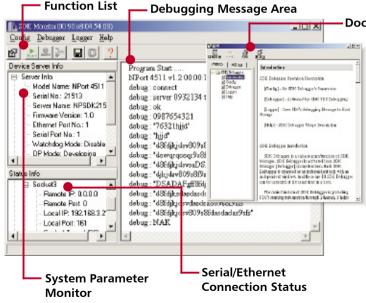

Management Tool—SDK Manager

SDK Manager is important for both NPort 4511 and the developer. Its major functions are:

- NPort 4511 configuration: Ethernet, Serial, and System parameters.
- Setting up NPort 4511's Password and Private Key.
- NPort 4511 software download: Application program, kernel, etc.
- Activating debugging utility
- Multi NPort 4511 Management: Simultaneous access of multiple NPort 4511s.

Debugging Tool—SDK Debugger

Documentation

SDK Debugger is designed for program debugging and end-user monitoring. Its major functions are:

- Display debugging messages.
- Monitor connection status.
- Display system status.
- Store operation status and messages.
